

DISCUSSION AND CONSENT FOR A SINUS LIFT

Patient's Name _____ Date of Birth _____

After a careful examination and study of my dental condition, I have been advised that I have inadequate bone where some missing tooth/teeth are. This lack of bone does not allow for the placing of dental implants without additional procedure/s.

Recommended Treatment: In order to treat this condition, it has been recommended that my treatment include bone regenerative (sinus augmentation) surgery. Local anesthetic will be administered to me as part of the treatment. Antibiotics and other medications may also be given. During this procedure, the gums may be opened to permit better access to the bone. Bone irregularities may be reshaped. Some bone may be removed to create a window to access the maxillary sinus. Bone graft material (my own bone, animal bone material (cow or pig) or bone obtained from tissue banks) will be placed in the areas of augmentation. Collagen wafer membranes made from the Achilles tendons of animals (cow or pig) may also be used to hold the bone graft material in place while it heals. My gum will be sutured back into position over the above materials.

The estimated cost for this restoration(s) is \$ _____ and is estimated to take _____ visits to complete.

Expected Benefits: The purpose of sinus augmentation bone regeneration surgery is to "grow" bone back to hopefully allow dental implant placement either at the same time as this surgery, or a few months later.

Principal Risks and Complications: All patients do not respond successfully to bone regenerative procedures. The procedure may not be successful in allowing a dental implant to be placed. Because each patient's condition is unique, long term success cannot be guaranteed. Complications that may result from surgery could involve the surgery procedure, bone regenerative materials, drugs, or anesthetics.

Some of the possible complications to surgery and/or medications include but are not limited to:

1. Pain, swelling, and postoperative bruising or discoloration of the face, neck, and mouth.
2. Numbness and tingling of the upper lip, chin, gums, teeth, cheek, and palate. Although rare, numbness could be permanent.
3. Infection of the bone that might require further treatment including hospitalization and surgery.
4. Mal-union, delayed union, or non-union of the bone graft replacement material to normal bone.
5. Lack of adequate bone growth into the bone graft replacement material.
6. Bleeding which may require blood transfusions or other extraordinary means to control hemorrhage.
7. Limitation of jaw function, stiffness of facial muscles and stiffness of jaw muscles.
8. Injury to the teeth (especially in the immediate area).
9. Referred pain to the ear, neck, and head.
10. Postoperative complications involving the sinuses, nose, nasal cavity, sense of smell, and altered sensations of the upper cheek and eyes.
11. Postoperative unfavorable reactions to drugs, such as nausea, vomiting, and allergy.
12. Possible loss of implant/s, teeth and/or bone segments.
13. Possible bruising and/or discoloration of the face, usually of a temporary nature
14. For patients who have taken Bisphosphonate drugs such as Fosamax, Actonel, Boniva or any other drug prescribed for osteoporosis or for treatment of metastatic bone cancer, there is an increased risk of osteonecrosis or failure of bone to heal properly following any surgical procedure involving bone.
15. Bone graft material may be used in conjunction with the Sinus Lift Procedure. Please check any material listed below that you do not want used on you:
 - ☐ Autogenous graft - Which transplants bone from one region to another region of the same individual
 - ☐ Allograft - Which transplants bone from one individual to a genetically non-identical individual of the same species (processed human bone)
 - ☐ Alloplast - Implantation of synthetic/ chemically derived bone substitutes or membranes (artificial bone)
 - ☐ Xenograft - Transplant of bone from another species (bovine bone)

There is no method that will accurately predict or evaluate how your gum and bone will heal. There may be a need for a 2nd procedure if the initial results are not satisfactory, or if a post-operative infection or complication necessitates removing the bone graft. In addition, the success of the surgery and/or dental implant procedures can be affected by medical conditions, dietary and nutritional problems, smoking, alcohol consumption, snuff and chewing tobacco, clenching and grinding of teeth, inadequate oral hygiene, and drugs or medications that I may be taking.

Alternatives to suggested Treatment: I understand that alternatives to sinus augmentation surgery may include:

- 1) No treatment,
- 2) Dental bridgework (if there are good adjacent teeth for supporting a fixed bridge),
- 3) Removable partial dentures, and
- 4) No teeth replacement.

Tobacco Use: Smoking and smokeless tobacco may adversely affect healing and may cause pain and/or a poor result, especially if used during the 1st month. (If you must smoke, keep it under 5 cigarettes a day and only smoke the 1st half of the cigarette and discard it.). Do not smoke the day before, the day of and 3 days after the sinus augmentation surgery. No smokeless tobacco.

Necessary Follow-up Care and Self-Care: In order to promote a successful outcome, it is important to:

1. Abide by the specific prescriptions and instructions given.
2. Return for post-operative check-ups as needed.
3. Not smoke or use smokeless tobacco.
4. Avoid using toothpicks, in the vicinity of the surgical site for at least one month.
5. Avoid using any kind of an oral irrigating device in the vicinity of the surgical site for at least one month.
6. Have any non-dissolvable sutures (stitches) and membranes removed.
7. Get the tooth/teeth replaced as recommended.
8. Follow through with any requests for additional and/or follow-up procedures

No Warranty or Guarantee: While in most cases bone regenerative surgery heals quickly and without any problems, complications such as those listed previously, can happen despite the best of care.

Acknowledgment

I have received information about the proposed treatment. I have discussed my treatment with the Dentist and have been given an opportunity to ask questions and have them fully answered; I understand the nature of the recommended treatment, alternate treatment options, and the risks of the recommended treatment.

I understand that I will be given a local anesthetic injection and that in rare situations, patients may have an allergic reaction to the anesthetic, an adverse medication reaction to the anesthetic, or temporary or permanent injury to nerves and/or blood vessels from the injection. I understand that the injection area(s) may be uncomfortable following treatment, and that my jaw may be stiff and sore from holding my mouth open during treatment.

I understand that unforeseen conditions may call for a modification or change from the anticipated surgical plan. These may include, but are not limited to, 1) placing the dental implant(s) at the same time the ridge augmentation bone regeneration surgery is done, or 2) termination of the procedure prior to completion of all of the surgery originally outlined.

I have provided as accurate and complete a medical and personal history as possible including antibiotics, drugs or other medications (prescription or non-prescription) I am currently taking, any prior drug reaction, allergies, diseases, symptoms, habits or conditions that might in any way relate to this surgical procedure. I will follow any and all treatment and post-treatment instructions as explained and directed to me and will permit the recommended follow-up procedures, including x-rays, to ensure the success of this procedure.

I have told Doctor about any present or prior head and neck radiation therapy. I have told Doctor about any present or prior use of bisphosphonate medications. Some common brand names are Zometa®, Aredia®, Boniva®, Fosamax®, and Actonel®.

I am aware that the practice of dentistry is not an exact science and I acknowledge that no guarantees or promises have been made to me concerning the treatment, my recovery or any results from the treatment to be rendered to me. While in most cases bone regenerative surgery heals quickly and without any problems, complications can happen despite the best of care. I understand that if any unexpected difficulties occur during treatment, I may be referred to another provider or a specialist for further care. I understand that this may result in additional cost(s) to me.

I am aware that I need to come back in for several post-operative check-ups so that healing may be monitored and evaluated. It may be necessary to have additional procedures, including removal of both non-resorbable sutures and non-resorbable membranes used in the sinus augmentation bone regeneration surgery.
